Part I Overview

Users use our USBCAN/CANalyst-II analyzer mainly for the following applications:

- 1、 Introduction to CAN bus: learn CAN bus, understand CAN bus principle, data format.
- 2、 CAN bus advanced: debugging CAN bus, debugging development board.
- 3、 CAN bus primary application: simple field debugging, data collection.
- 4 、 CAN bus advanced application: secondary development, development of real-time monitoring system.
- 5、 CAN bus final application: before based on the domestic famous brand (Chou Li-gong or Jiang) of the product development of their own application software or monitoring interface, and now looking for alternatives.

Part II Guidelines for Various Applications

2.1 Application I:

Introduction to CAN bus: learn CAN bus, understand CAN bus principle, data format.

Our USBCAN\CANalyst-II analyser is a dual-channel product, two channels can be directly networked, and the channels can send and receive data to and from each other, so that CAN data can be sent and received without accessing other devices.

2.1.1 Steps:

Install the USB driver, install the original debugging tool, do the sending and receiving test between the two channels.

Then you can use Zhou Ligong CANtest and CANpro software. (Zhou Ligong's CANtest and CANpro software, compared with the original debugging tool, has richer functions, users can try to use these two software, note: please operate according to the instructions).

- 14.Annex 7: Frequently Asked Questions and Handling.pdf

2.2 Application II:

CAN bus advanced: debugging CAN bus, debugging development board.

Use our USBCAN\CANalyst-II analyzer to debug the self-programmed development board.

2.2.1 Steps:

Install the USB driver, install the original debugging tool, do the send/receive test between the two channels, and confirm the baud rate of the device.

Then you can use Zhou Ligong CANtest and CANpro software. (Zhou Ligong CANtest and CANpro software, compared with the original debugging tools, more functional, the user can be paid to try to use these two software, note: please follow the instructions to operate).

2.2.2 References

- 6.Plug-in 2: Baud Rate Detection Tool User Manual.pdf
- 14.Annex 7: Frequently Asked Questions and Handling.pdf

2.2.3 Warm Tips

The key to debugging the development board is to confirm the waveform and baud rate. Because the development board is in the programming stage, the actual baud rate may be different from the desired baud rate.

Refer to item 10 in 14.Annex 7: Common Problems and Handling.pdf.

2.3 Application III:

Primary CAN bus application: simple on-site debugging, data collection.

Connection into a normal running CAN network.

2.3.1 Steps:

Install the USB driver, install the original debugging tool, do the send/receive test between two channels, and confirm the baud rate of the device.

Then you can use the CANtest and CANpro software of Chou Li-gong. (Chou Li-gong's CANtest and CANpro software, compared with the original debugging tool, has richer functions, users can try to use these two software, note: please operate according to the instructions).

17. Annex 10: CAN-bus cable socket wiring specification.pdf

2.4 Application IV:

CAN bus advanced application: secondary development, development of real-time monitoring system.

Based on the secondary development interface function, develop your own software.

2.4.1 Steps

Install the USB driver, install the original debugging tool, do the transceiver test between two channels, refer to the secondary development manual and sample development.

2.5 Application V

CAN bus end-level applications: Previously developed their own application software or monitoring interface based on related products of famous domestic brands (Chou Li-gong or Jiyang), and now looking for low-cost alternatives. Or originally used Chou Li-gong's CANTest and CANPro software as a debugging tool, now looking for low-cost alternatives.

2.5.1 Steps:

The CANTest software is originally used as a debugging tool for models such as USBCAN-I, USBCAN-II, USBCAN-2A, USBCAN-I+, USBCAN-II+, USBCAN-E-U, and USBCAN-2E-U. To use our products, simply replace the ControlCAN.dll file and select the appropriate model. For best results, use the latest USBCAN-2E-U model and select it in the CANTest software.

If you use CANPro software as a debugging tool and model CANalyst-II, you can replace the ControlCAN.dll file with our product and continue to use CANPro software while selecting the corresponding model.

If you have developed software products based on Zhou Ligong's USBCAN, USBCAN-2E-U, or other models, you can use the ControlCAN.dll library file. This file should be placed in the same folder as the .exe file in your software installation directory. To replace the file, locate it and replace it with the file of the same name from the CD-ROM.

If customers need to replace the hardware and use Zhou Ligong driver and library files without any modifications, they can contact technical support for an upgrade that is fully compatible and plug-and-play. Please note that this model is intended for learning and communication purposes only and should not be used for commercial purposes.
